Vehicle 1, a 1995 Honda Civic was traveling north on a two lane undivided roadway, negotiating a curve to the left on an upgrade.
V1 went over the right lane line, overcorrected and went over the left lane line into the southbound lane.
V1 overcorrected again and went across the northbound lane, over the right lane line.

Language Understanding

Machine Reasoning

Object Detection

Face Recognition

Why AI now?

Confluence of factors

- Advances in computing HW
- Advances in AI algorithm(ML, DL)
- Data explosion

Cognitive Computing / AI is addressing key issues:

- ✓ Cognitive overload (data volume and pace)
- ✓ Recent advances in AI are poised to reduce the cost of analysis and prediction; helping improve decisions
- ✓ Economic theory tells us that as the cost of machine prediction falls, machines will do more and more prediction (Agrawal, Gans & Goldfarb, 2017, HBR)

Economic theory also suggests that **AI will substantially raise the value of human judgment** which is key in decision making

(AI=Augmented Intelligence)

Image classification

- Use of **Deep Neural Networks** and GPU **hardware accelerators** led to rapid error rate reduction

ImageNet Classification Error (1000 objects)

ImageNet Classification Accuracy

Mobile and Body Worn Cameras

Motion and Activity Analysis

$$f(S, Y) = \sum_{i=1}^m \underbrace{\varphi(y_i | s_i)}_{(1)} + \mu \sum_{1 \leq k \leq i-1}^l \underbrace{p(z_i | z_{i-k}, \dots, z_{i-1})}_{(2)}$$

$X = \{x_1, x_2, \dots, x_n\}$: a sequence of a video X
 $S = \{s_1, s_2, \dots, s_m\}$: random segmentation of sequence
 $Y = \{y_1, y_2, \dots, y_m\}$: event class labels

Evolve our MobileFirst platform to leverage the transformational change taking place by wearable devices in the enterprise

- Wearable and IOT device connectivity via mobile (mobile-as-a-gateway)
- Ad-hoc computing in disconnect mode, on mobile-device analytics and business logic (mobile-as-a-hub)
- Multi modal interactions for seamless integrated user experience between wearables and mobile devices
- Understand people activities based on wearable enabled data

Employee Health and Safety

Employee safety and wellness kit enables the development of mobile applications that leverage wearable data and safety analytics.

Smart Mobile Worker

Enable mobile workers to use combination of wearable devices such as glasses, smart watches and gesture devices to interact with the computing systems and perform her tasks

Healthcare and Wellness

Drive cognitive health and wellness services via new exogenous data
Leverage wearable devices in Mobile HC/Wellness Solutions

A **Cognitive Visually Aware Technical Advisor** is an integrated wearable cognitive system that sees and understands what the technician is doing (what he is looking at, what he is holding or pointing to, what actions he is executing) and exploits that derived situational context to allow the technician to ask human-oriented natural language technical questions and receive accurate and concise responses to support safe and efficient work flow

Augmented Reality & AI

Joe is a maintenance worker. He is sent to check a leaky connection on a pump flange. Joe is new at this site and has never worked on this unit before.

Joe knows that he should first check the torque on the flange bolts. He looks at the flange via his see-through **smart AR glasses**, points to the bolt (see finger pointing to bolt in the image) and asks:

1 Hey Watson, how tight should these be?

Watson processes the view from Joe's smart glasses camera and understands that Joe is pointing to a bolt on a flange located above the pump (Watson figures out the ID of the pump), and responds:

2 Joe, the torque on these bolts should be 27 ft-lbs

Joe checks the bolt torque and it is OK. He decides to replace the flange gasket, and asks:

3 Hey Watson, what gasket type should I use here?

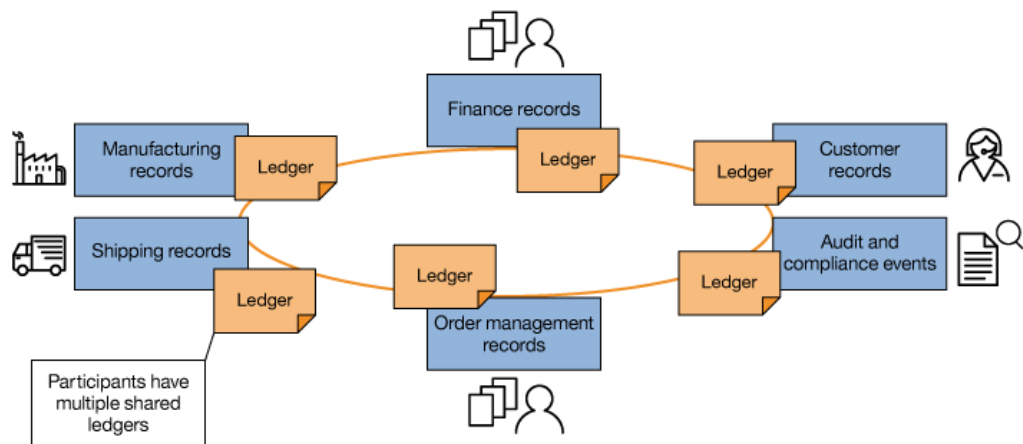

Watson remembers the context of what Joe is looking at (the flange) and looks up the correct type of gasket to use (based on material type flowing in pipe, pressure, temperature, etc...) and says...¹⁶

4 Joe, Please use a THERMa-PUR Style 4122 Spiral Wound Gasket

5 Thanks Watson!

IoT

The Internet of Things in construction

The Internet of Things (IoT) used with analytics, mobile and cloud technologies has the potential to transform the engineering, construction and operations (EC&O) industry. Taking advantage of the IoT can transform building construction to make it more cost effective, sustainable and safe.

IBM Sets Tera-scale Machine Learning Benchmark Record with POWER9 and NVIDIA GPUs; Available Soon in PowerAI

Today, at IBM THINK in Las Vegas, we are reporting a breakthrough in AI performance using new software and algorithms on optimized hardware, including POWER9 with NVIDIA® V100™ GPUs.

In a newly published benchmark, using an online advertising dataset released by Criteo Labs with over 4 billion training examples, we train a logistic regression classifier in 91.5 seconds. This training time is 46x faster than the best result that has been previously reported, which used TensorFlow on Google Cloud Platform to train the same model in 70 minutes.

The AI software behind the speed-up is a new library developed over the past two years by our team at IBM Research in Zurich called IBM Snap Machine Learning (Snap

Cognitive IoT is about **changing outcomes**

Cognitive IoT, much like a human, learns about a system and creates a model. It then reasons with this model to find the inputs to the system that will optimize its outcomes. In this way it can manage large cyber physical systems and transform industries, thereby creating cognitive businesses.

We are working with clients to further enhance Watson IoT capabilities by leveraging emerging technologies

Wearables

IBM and a US steel producer have launched a pilot solution that watches worker locations, biometrics and environments over time, Spotting real-time risks with a cognitive Internet of Things on the factory floor.

Drones

IBM is helping a Drone manufacturer in the Netherlands by enabling drones with cognitive image-processing technology that has the potential to revolutionize cell tower inspection practices.

Robotics

IBM is working in partnership with several clients to provide our Cognitive capabilities on top of adaptive robots

Virtual / Augmented Reality

IBM has been working over the past two years on AR/VR proof of concepts that go beyond the today's commercially available software. For example, multi object image recognition has use cases in planogram compliance and personalized shopping experiences.

Engaging and empowering citizens

Letting communities upload and visualise their own performance
